2 DNF with many prime implicants

3 Cube partitions

- Neighboring partitions for NUD-k-term DNF
- General Splitting Problem for Cube Partitions

Open Problems

A 3 b

Main Result in a Nutshell

- Exact characterization of the 2^k 1 prime implicants of those k-term DNF having 2^k 1 prime implicants, which has been known to be the maximum possible since late 1970's.
- Relates to a particular type of decision tree.

Main Result in a Nutshell

- Exact characterization of the 2^k 1 prime implicants of those k-term DNF having 2^k 1 prime implicants, which has been known to be the maximum possible since late 1970's.
- Relates to a particular type of decision tree.
- Next: One reason it's important—at least to me. Then on to a few definitions and main talk.

A Bit of a Teenage Boy's Dream

• I looked at Knuth's *The Art of Computer Programming* in the 1970's or perhaps early 1980's.

A Bit of a Teenage Boy's Dream

- I looked at Knuth's *The Art of Computer Programming* in the 1970's or perhaps early 1980's.
- For some reason, it didn't mention me!

A Bit of a Teenage Boy's Dream

- I looked at Knuth's *The Art of Computer Programming* in the 1970's or perhaps early 1980's.
- For some reason, it didn't mention me!
- Maybe because this was when I was somewhere around 13-19?

A Bit of a Teenage Boy's Dream

- I looked at Knuth's *The Art of Computer Programming* in the 1970's or perhaps early 1980's.
- For some reason, it didn't mention me!
- Maybe because this was when I was somewhere around 13–19?
- But now, "Bitte ein Bit!", (Slogan of Bitburger Brauerie in 1951 and again today), Volume 4 is being released in Fascicles, and in Pre-Fascicle 0B, Section 7.1.1, "Boolean Basics" Problem 32 is about this, and solution to 32(b) cites our ECCC Report!

Basic Definitions

- *n*-dimensional hypercube: $\{0,1\}^n$
- Cube or term: 0 * 1 or $\bar{x} \wedge z$
- Union of k cubes or k-term DNF: $T_1 \lor \ldots \lor T_k$
- Implicant of $A \subseteq \{0,1\}^n$: cube contained in A
- Prime implicant of $A \subseteq \{0,1\}^n$: maximal cube contained in A

k-term DNF with the Largest Number of Prime Implicants

Lemma

Every k-term NUD has $2^k - 1$ prime implicants.

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

k-term DNF with the Largest Number of Prime Implicants

Lemma

Every k-term NUD has $2^k - 1$ prime implicants.

One for each nonempty subset of the leaves.

k-term DNF with the Largest Number of Prime Implicants

Lemma

Every k-term NUD has $2^k - 1$ prime implicants.

One for each nonempty subset of the leaves.

• Is that all?

/⊒ > < ∃ >

k-term DNF with the Largest Number of Prime Implicants

Lemma

Every k-term NUD has $2^k - 1$ prime implicants.

One for each nonempty subset of the leaves.

• Is that all?

Theorem

A k-term DNF has $2^k - 1$ prime implicants iff it is a NUD.

Neighboring partitions for NUD-k-term DNF General Splitting Problem for Cube Partitions

Definitions: Distance of Disjoint Subcubes of $\{0, 1\}^n$

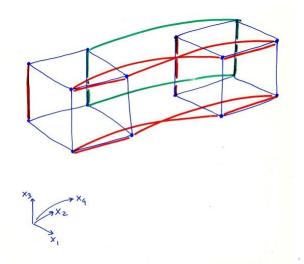

• Distance of two cubes: number of conflicting coordinates

•
$$dist(0 * 10, 110*) = dist(\bar{x}_1 x_3 \bar{x}_4, x_1 x_2 \bar{x}_3) = 2$$

- Partition of the hypercube into cubes is distance-k if any two of its cubes have distance at most k
- Distance 1: neighboring

Splitting Lemma

Lemma (Splitting Lemma)

For every neighboring partition there is a variable that occurs in every term (either negated or unnegated).

- Kullmann (2000), using matroid theory
- Related results in satisfiablity theory—Aharoni, Linial (1986), Davydov, Davydova, Kleine-Büning (1998)
- Ours: elementary combinatorial proof, simplified by Sgall

Neighboring partitions for NUD-k-term DNF General Splitting Problem for Cube Partitions

・ 戸 ト ・ ヨ ト ・ ヨ

Proof of the Splitting Lemma: Induction

- Want to show: For every neighboring partition there is a variable that occurs in every term.
- Proof is by induction on number of variables; trivial for 1 variable.

Neighboring partitions for NUD-k-term DNF General Splitting Problem for Cube Partitions

・ 同 ト ・ ヨ ト ・ ヨ ト

Proof of the Splitting Lemma: Induction

- Want to show: For every neighboring partition there is a variable that occurs in every term.
- Proof is by induction on number of variables; trivial for 1 variable.
- For > 1 variable; holds on subcube induced by a literal by inductive hypothesis.
- With *s* variables, 2*s* literals but only *s* variables, so must be two literals that both have *same* variable mentioned in induced subcube.

Say common variable is z.

Splittability of Partitions

- Splitting Lemma showed: for every neighboring partition, can split cube in half respecting the partition.
- How much can a split in half respect a more general partition?
- Put $T = (T_1, \ldots, T_m)$ = cube partition of *n*-dim hypercube
- Define:

Influence of variable x_i on \mathcal{T} :

$$\mathbf{v}_i^{\mathcal{T}} = \sum \{ 2^{-|\mathcal{T}_j|} : \mathbf{x}_i \in \mathcal{T}_j \text{ or } ar{\mathbf{x}}_i \in \mathcal{T}_j \} \; ,$$

where |T| = number vectors satisfying T.

$$\begin{aligned} \alpha_n &= \min_{\mathcal{T}} \max_i v_i^{\mathcal{T}} \\ \alpha_n^d &= \min_{\mathcal{T}: distance \ d} \max_i v_i^{\mathcal{T}} \end{aligned}$$

• From Splitting Lemma: $\alpha_n^1 = 1$.

Neighboring partitions for NUD-k-term DNF General Splitting Problem for Cube Partitions

Splittability of Partitions

- Splitting Lemma showed: for every neighboring partition, can split cube in half respecting the partition.
- How much can a split in half respect a more general partition?
- Put $T = (T_1, \ldots, T_m)$ = cube partition of *n*-dim hypercube
- Define:

Influence of variable x_i on \mathcal{T} :

$$\mathbf{v}_i^{\mathcal{T}} = \sum \{ 2^{-|\mathcal{T}_j|} : \mathbf{x}_i \in \mathcal{T}_j \text{ or } ar{\mathbf{x}}_i \in \mathcal{T}_j \} \; ,$$

where |T| = number vectors satisfying T.

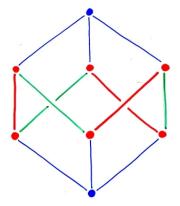

$$\begin{aligned} \alpha_n &= \min_{\mathcal{T}} \max_i v_i^{\mathcal{T}} \\ \alpha_n^d &= \min_{\mathcal{T}: distance \ d} \max_i v_i^{\mathcal{T}} \end{aligned}$$

• From Splitting Lemma: $\alpha_n^1 = 1$. Theorem: $\alpha_n^3 < 1$
