

# Doubly Efficient Interactive Proofs

Ron Rothblum

# Outsourcing Computation

Weak client outsources computation to the cloud.

# Outsourcing Computation

We do not want to blindly trust the cloud.

**Key security concern:**

*Correctness:* why should we trust the server's answer?

# Interactive Proofs to the Rescue?

Interactive Proof [GMR85]: prover  $P$  tries to *interactively* convince a polynomial-time verifier  $V$  that  $f(x) = y$ .

$f(x) = y \Rightarrow P$  convinces  $V$ .

$f(x) \neq y \Rightarrow$  no  $P^*$  can convince  $V$  w.p.  $\geq 1/2$ .

Key Problem: in classical results complexity of **proving** is actually exponential:

IP=PSPACE [LFKN90, Shamir90]: Interactive Proofs for space  $S$  computations with  $2^{\text{poly}(S)}$  prover,  $\text{poly}(n, S)$  verification,  $\text{poly}(S)$  rounds.

# Doubly Efficient Interactive Proof

[GKR08]

Interactive proof for  $f(x) = y$  where the prover is **efficient**, and the verifier is **super efficient**.

Proportional to  
complexity of  $f$

Much faster than  
complexity of  $f$

Soundness holds against any (computationally unbounded) cheating prover.

# Why Proof and not Arguments\*?

1. Security against *unbounded* adversary.
  - Post-quantum secure, post post quantum secure...
2. No reliance on unproven crypto assumptions
3. Do not use any expensive crypto operations
  - Even if not currently practical, no clear bottleneck (e.g., [GKR08])...

\* Disclaimer: arguments are GREAT! (e.g., [KRR14])

# Doubly Efficient Interactive Proofs: The State of the Art

## 1) [GKR08]: Bounded Depth

- Any **bounded-depth** circuit.
- (Almost) linear time verifier, poly-time prover.
- Number of rounds proportional to circuit depth.

Logspace uniform  
 $NC$

## 2) [RRR16]: Bounded Space

- Any **bounded-space** computation.
- (Almost) linear time verifier, poly-time prover.
- $O(1)$  rounds.

# Constant-Round Doubly Efficient Interactive Proofs

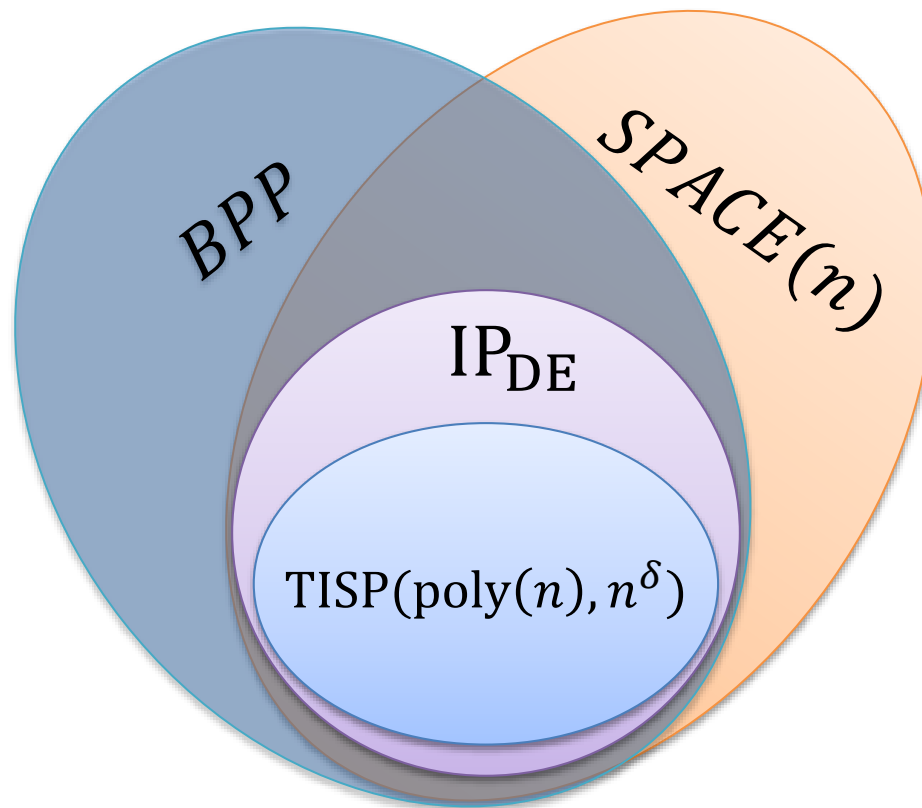

Theorem [RRR16]:  $\exists \delta > 0$  s.t. every language computable in  $\text{poly}(n)$  time and  $n^\delta$  space has an unconditionally sound interactive proof where:

1. Verifier is (almost) linear time.
2. Prover is polynomial-time.
3. Constant number of rounds.

# Tightness

Define  $IP_{DE}$  as class of languages having doubly efficient interactive proofs.

# Roadmap: A Taste of the Proof

Iterative construction:

1. Start with interactive proof for short computations.
2. Build interactive proof for slightly longer computations.
3. Repeat.

# Iterative Construction

Suppose we have interactive proofs for time  $T/k$  and space  $S$  computations.

Consider a time  $T$  and space  $S$  computation.

# Divide & Conquer

**Divide:** Prover sends Turing machine configuration in  $k \ll T$  intermediate steps.

**Conquer?** recurse on all subcomputations.

**Problem:** verification blows up, no savings.

# Divide & Conquer

**Divide:** Prover sends Turing machine configuration in  $k \ll T$  intermediate steps.

**Conquer?** Choose a few at random and recurse.

**Problem:** huge soundness error.

# Best of Both Worlds?

Can we **batch verify**  $k$  instances much more efficiently than  $k$  independent executions.

## Goal:

- Suppose  $x \in L$  can be verified in time  $t$ .
- Want to verify  $x_1, \dots, x_k \in L$  in  $\ll k \cdot t$  time.

# Concrete Example: Batch Verification of *RSA* moduli

Def: integer  $N$  is an ***RSA modulus*** if it is the product of two  $m$ -bit primes  $N = p \cdot q$ .

The proof that  $N$  is an RSA modulus is its factorization.  
Can we verify  $k$  RSA moduli more efficiently?

$P(p_1, q_1, \dots, p_k, q_k)$

$V(N_1, \dots, N_k)$

$\ll k \cdot m$   
communication

# Warmup: Batch Verification for **UP**

**UP**  $\subseteq$  **NP** are all relations with unique accepting witnesses.

$m =$  witness length

Theorem [RRR16]: Every  $L \in \mathbf{UP}$ , has an interactive proof for verifying that  $x_1, \dots, x_k \in L$  with  $m \cdot \text{polylog}(k) + \tilde{O}(k)$  communication.

For batch verification of *interactive* proofs we introduce interactive analogs of **UP** and **PCP**.

# Constant-Round Doubly Efficient Interactive Proofs

Theorem [RRR16]:  $\exists \delta > 0$  s.t. every language computable in  $\text{poly}(n)$  time and  $n^\delta$  space has an unconditionally sound interactive proof where:

1. Verifier is (almost) linear time.
2. Prover is polynomial-time.
3. Constant number of rounds.

# Sublinear Time Verification

**Motivation:** statistical analysis of vast amounts of data.

# Sublinear Time Verification

Can we verify without even reading the input?

Yes! If we allow for *approximation*.

Following **Property Testing** [GGR98]: only required to reject inputs that are far from the language.

# Sublinear Time Verification

Revisiting classical notions of proof-systems:

<b>NP</b>	<b>Gur-R13, Fischer-Goldhirsh-Lachish13, Goldreich-Gur-R15</b>
<b>Interactive Proof</b>	<b>Rothblum-Vadhan-Wigderson13, Kalai-R15, Goldreich-Gur-R15, Goldreich-Gur16, Reingold-Rothblum-R16, Gur-R17</b>
<b>Zero-Knowledge</b>	<b>Berman-R-Vaikuntanathan17</b>
<b>PCP/MIP</b>	<b>Ergun-Kumar-Rubinfeld04, Dinur-Reingold06, BenSasson-Goldreich-Harsha-Sudan-Vadhan06, Gur-Ramnarayan-R17</b>

# Open Problems

- Research directions:
  - Bridge theory and practice.
  - **Sublinear** time verification.
- Concrete questions:
  - **IP=PSPACE** with “efficient” prover.
  - Batch verification for all of **NP**.
  - **[GR17]**: Simpler and more efficient protocols (even for smaller classes).
  - Improve **[RRR16]** round complexity: even exponentially.
